

## Voting System

**Aim:** To develop a simple Python program that checks whether a person is eligible to vote based on their age, displays their name along with eligibility status, and prints completion messages using a loop.

### Error code:

```
print("Voting System")

name = input("Enter name: ")

age = input("Enter age: ")

if age >= 18

    print("Eligible")

else

    print("Not Eligible")

print("Voter:", Name)

for i in range(2)

    print("Done")

print("End")
```

**Output of error code:**

The screenshot shows a terminal window titled "Run" with the title bar "error voting system". The terminal interface includes standard navigation keys (Up, Down, Left, Right, Home, End) and icons for Run, Stop, and Help. The main area displays the following text:

```
C:\Users\MAHIDHAVAL\AppData\Local\Microsoft\WindowsApp
  File "D:\dhaval\error voting system.py", line 4
    if age >= 18
               ^
SyntaxError: expected ':'
Process finished with exit code 1
```

**List of Error:****1. Syntax Error – All code written in one line**

Python does not allow multiple statements in one line without proper separation.

Error:

SyntaxError: invalid syntax

---

**2. Missing Proper Indentation**

if and else statements must have proper indentation.

Example of wrong:

```
if age >= 18: print("Eligible")
else: print("Not Eligible")
```

This may cause readability issues and sometimes syntax problems.

---

### 3. Invalid Input Error (Runtime Error)

If the user enters text instead of number for age:

```
age = int(input("Enter age: "))
```

It will give:

```
ValueError: invalid literal for int()
```

---

### 4. Logical Issue (Optional)

```
for i in range(2):  
    print("Done")
```

This prints "Done" two times.

It may be unnecessary.

#### Correct code:

```
print("Voting System")  
  
name = input("Enter name: ")  
  
age = int(input("Enter age: "))  
  
if age >= 18:  
  
    print("Eligible")  
  
else:  
  
    print("Not Eligible")  
  
    print("Voter:", name)  
  
for i in range(2):  
  
    print("Done")  
  
print("End")
```

**Output of correct code:**

```
Run   ⚡ correct voting system ×

C:  C:\Users\MAHIDHAVAL\AppData\Local\Microsoft\WindowsApps
↓  Voting System
→  Enter name: dhaval
←  Enter age: 17
☰  Not Eligible
📄 Voter: dhaval
🗑 Done
Done
End

Process finished with exit code 0
```
